
ZANDUR RECYCLING RUBBER FLOORING

Z007

First and Foremost, Zandur flooring products are designed to be durable and have one of the longest life cycles available as evidenced by its industry leading warranty.

Durability is the key to a green product as the longer the product lasts, the less energy and resources are required to remove, replace and re-manufacture the flooring. Zandur has established a simple yet effective method to recycle all of its rubber flooring products should they surpass their useful life. Instead of breaking down the product and re-manufacturing it into other products which is very energy intensive, Zandur has developed a process in which we can re-surface the existing materials for re-use as floor covering.

Recycling Procedure:

1. Prior to returning materials, contact Zandur for a used material return form which specifies what material is being returned.
2. Used material returned to Zandur must be segregated by color and clean of sub-floor materials other than adhesive. Cut tiles must be packaged separate from full tiles.
3. Upon receipt of material, Zandur will inspect materials to ensure they meet the specifications of the return form. In the event they are not Zandur material or do not meet required specifications, the owner will be notified and the materials will be discarded at their cost.
4. Upon acceptance of materials, Zandur converts tiles into new product made available when quantities permit.

Zandur is proud to offer this program in keeping with our commitment to being your sustainable flooring choice.
